

NEW TIME-SAVING ADVANCED FEATURE!

Ad-hoc creation of Master Asset Records
with **Fluke 729/740/750** Documenting
Process Calibrators & **ProCalV5**
Calibration Software

How It Works

- Calibration results from the Fluke DPC creates a new Master Asset record when Tag I.D.s are not recognized
- The Date/Time and who calibrated are logged on the master asset record
- Calibration results for an existing asset will be automatically saved and linked to that record
- Subsequent calibrations will follow the initially uploaded test routine
- eSignature approvals, schedules & workflow can be configured for future events
- The test standard used is automatically assigned to the historical record
- Results are databased & calibration certificates can be printed on demand
